

D-BOARD®

GRAPHIC CARDBOARD 100% RECYCLABLE

Ecological and versatile material

The D-Board is a graphic cardboard which is designed for flat printing, adhesion, glueing, stand construction, furniture, displays for different events and P.O.S.

Its production incorporates recycled cardboard with 100% recyclable raw material.

D-Board exists in three qualities:

Sandwich construction (Inverted corrugated board or ICB) which allows producing a lightweight product with very high durability properties. The D-Board can easily be imprinted because of its flat surface. It can be shaped and adapted to the 3D. We can suggest you different solutions for small series as well as for large orders at very competitive prices.

The D-Board Light is a structure reminiscent of the very durable flatter and smoother Honeycomb cells (8 mm cells) which allows a more precise impression and offers an easy and clear cut. The boards with a thickness from 5 to 30 mm give us the freedom to create objects and structures in 3 dimensions at a low cost.

The D-Board Light Kraft colour is designed for all the jobs where you want to show the recycled and/or ecological side of your projects.

Accessories for D-Board and D-Board Light

The three qualities allow complete and easy implementation thanks to the accessories specially adapted to your requirements: screws, profiles, conformable bands for finishing the panel edges.
